How to save date or datetime in neo4j , and how linkurious will show date properties

2 posts by 2 authors

דניאלה אסף

Apr 19

I use python bulbs for neo4jserver. I need to load data from xml files into neo4j .

some of the properties in the xml are DateTime type.

I also need to calculate minDate and MaxDate for each node.

I can't save the dates as strings because I cannot compare min date on string.

if I have '2015-01-20' is it ok tho save it as int 20150101 , or to convert it to timestamp in python (how ?)

I would like to use "linkurious" and display The properties of the nodes and show the dates not as a number but string. how linkurious can convert the date int property to format yyyy-MM-dd ?

Do I need to save the date property twice ? (one int format and the second string format ?)

Hello,

Linkurious doesn't automagically converts data types yet, so the simplest solution is to duplicate the dates to store them as integers and as formatted strings.
