Collaborator

CSV as a standard doesn't really support a field starting with a quote, having a couple of characters then quote and then having even more characters after that ending quote. It's considered bad input data. The `BufferedCharSeeker` didn't really handle that case either, but instead of throwing an explicit exception then bad data was extracted instead.

This commit makes that case explicit by throwing exception, providing source information and line number about which field in the input data contained the invalid field.
