

neo4j 2.2.0 - cypher query with node and relationship id gives strange results

In the example graph with the movies, I want to find who was "Neo" in "The Matrix".
I know that the node id is 0 and the relationship id is also 0, so I try to execute the following query:

```
start The_Matrix=node(0), Neo=relationship(0)
match (The_Matrix)-[Neo]-(person:Person)
return The_Matrix.title, Neo.roles, person;
```

I would expect only one person but this query returns all the persons that has any relationship with the node 0. Where am I wrong?

P.S. I **want** to use node and relationship ids in my queries.
