Anybody else has had individual properties set using rest api sometimes sometimes doesn't take into effect? It only happens sometimes. We run in a HA environment. Anybody have any ideas? We are on Neo4j 2.1.3 enterprise on CentOS

Thanks!

How do you see that? Any error messages? Deadlocks? What does the response look like in such cases?

Are you writing to master or slaves?

Writing to slaves. The response always is a 2xx success.

Sorry we write to a LB that covers neo4j master and slaves (2).

Does it write to all the same request? Or does it direct writes to master?

Perhaps the property updated is only delayed by the slave's pull interval to show up on the slave?
